

Dreamcatcher

PREPARED FOR KRISTIN SCHOOL

Ark Components

An open, self-sovereign architecture for durable personal AI: a person-owned Ark with a Conscience boundary, Archive, Vault, Model Socket, Toolbay, and open ports.

WHAT AN ARK IS

**A portable
operating system
for continuity.**

An Ark carries
precious continuity
for the person it is
assigned to.

What it represents

Durable, portable, protected, and specific enough to build around. The Ark is the owner's long-running home for history, permissions, tools, models, and carefully governed action.

THE SIMPLE OPERATING SYSTEM

The Ark stays. Capabilities plug in.

Model Socket

The AI model plugs into a defined socket. Better, safer, cheaper, or local models can replace it without replacing the Ark.

Toolbay

Tools, connectors, workflows, and interfaces come and go. The Ark composes them, constrains them, and can revoke them.

Conscience

The active boundary checks what can cross, asks for approval when needed, and explains decisions instead of hiding them.

ARCHITECTURE VIEW

The Ark holds continuity while capabilities plug in.

ARCHIVE AND VAULT

Archive

The long-running history: work, learning evidence, projects, feedback, values, preferences, decisions, provenance, and reflections.

The Archive is how continuity compounds over years.

Vault

The tightly constrained chamber for sensitive material: credentials, keys, payment rails, recovery material, biometrics, private records, and high-risk permissions.

The Vault answers, redacts, or refuses without casually exposing raw secrets.

SOCKETS AND BAYS

Modular by design.

The owner should be able to change the intelligence engine and the tools without starting again.

The operating posture

- models plug into the Model Socket;
- tools plug into the Toolbay;
- the Archive preserves long context;
- the Vault stays private and constrained;
- the Conscience governs movement across boundaries.

CONSCIENCE

The boundary with judgement.

The Conscience governs flows into, out of, and within the Ark.

It checks and explains

- owner permissions, age, role, law, policy, safety, privacy, and cost;
- what a model may see;
- what a tool may do;
- what a parent, teacher, child, or external service may receive.

OPEN OWNERSHIP

Self-sovereign ownership has to be inspectable.

Open source where possible

Core mechanisms should be understandable, reviewable, and replaceable rather than trapped behind a vendor wall.

Open protocols

Export, restore, migration, permission grants, and audit trails should be protocol-shaped, not screenshot-shaped.

Owner control

The Ark belongs to the individual it is assigned to. Institutions can contribute and verify without taking ownership.

OUTLAST

The promise

The Ark should outlast the model, the tool, the app, the school year, the vendor contract, and the device.

Continuity is the product.

Everything else is a
replaceable capability
around the person-
owned Ark.

NOT ONLY STUDENTS

An Ark can be assigned to any person.

Child Ark

Learning history, support, reflection, age-appropriate permissions, and carefully bounded help.

Parent Ark

Family context, values, records, lived judgement, resource coordination, and safe contribution to the child's world.

Teacher Ark

Learning design, feedback, classroom evidence, professional memory, and school-approved channels into student work.

COMMUNITY VIEW

Each person can own an Ark. Permissioned flows connect them.

Conscience on every Ark explains what can cross.

REFERENCE SENTENCE

The Ark is the owned continuity layer.

A durable personal operating system where the Archive remembers, the Vault protects, the Conscience governs, models plug into sockets, tools plug into bays, and the owner can outlast every replaceable part.
