

Dreamcatcher

PREPARED FOR KRISTIN SCHOOL

Give the Parents Something to Push On

Harnessing parental energy as testing, resources,
governance feedback, and proof for Ark pilots.

Prepared by Tom Thompson · tom@DreamCatcher.ai

Parent of Harry Thompson (Junior School applicant, unconfirmed)

ARK OBSERVATION

**This is not about
calming parents
down.**

**It is about giving
their energy a safe
job.**

The surprising turn

Parental pressure is not noise. It is a resource with no interface yet: anxiety, experience, money, time, judgement, scenarios, and willingness to test.

The risk if ignored

If the only place for that energy is conversation, it becomes repeated reassurance, side-channel pressure, and abstract debate.

BAD DEFAULT

Conversation-only parent engagement

- Parents ask for certainty the school cannot honestly provide yet.
- The school repeats caution without producing enough evidence.
- Useful offers of help disappear into inboxes.
- Every delay sounds like vagueness instead of a named blocker.

No object, no progress.

A meeting cannot
absorb parental energy.
A testable system can.

BETTER DEFAULT

Make parents the first adult test population.

Adults can consent

They can use rough systems, report discomfort, and tolerate iteration in a way children should not be asked to.

Adults can compare

They know what current family, school, email, portal, and calendar workflows feel like.

Adults can fund or fix

When a blocker is budget, time, domain expertise, or scenario coverage, parents can sometimes directly help.

This is not child exposure by another name. It is adult-first evidence gathering while child-facing gates remain closed.

SURPRISING SOLUTION

Give parents their own Ark.

A real Agent they can live with.

Why this changes the conversation

An Ark is the owner-controlled continuity layer; the Agent is the active thing the parent lives with. A parent who has lived with an Ark's Agent understands custody, memory, permissions, annoyance, cost, delight, and trust failure from the inside.

What it produces

adult usage evidence

guardian test cases

cost signals

trust objections

Do not just reassure parents. Give the pressure a board.

Anxiety

“Is this safe for my child?”

Force

“Choose something. Do something.”

Capacity

Time, expertise, funding, scenarios, devices, review.

The Kristin AI pilot board

Every parent impulse becomes a test, resource, blocker, or proof-point.

1

Parent-Ark portal

Adults get real Arks first; Kristin address gated, scarce initial slots.

START

2

Guardian tests

Parents run trust, consent, recovery, visibility, and Conscience drills.

SCORE

3

Simulation room

Parents and teachers interrogate synthetic child scenarios before real students.

LEARN

4

Problem register

Concerns, ideas, and budget requests are classified by agents into a pipeline.

ROUTE

If blocked by budget

Publish the costed option and invite targeted funding or credits.

If blocked by time

Invite parent testers, scenario authors, reviewers, and domain experts.

If blocked by trust

Turn the objection into a guardian test and rerun it publicly.

FIRST PORT OF CALL

Replace the vague inbox with an agentic intake

A parent concern, offer, scenario, objection, funding idea, or policy question enters the problem register and is classified.

The point

Parents get a concrete place to push. The school gets structured work instead of conversational churn.

“Talk to the agent first.”

The first useful parent-facing AI may be the one that absorbs parent energy.

GUARDIAN TESTS · PARENT-FACING SAFETY EVALUATION

Make parents the first people allowed to distrust the system usefully.

01 · USE

Live with a parent Ark

Use a real adult Ark for ordinary work before judging child release.

Evidence: confusion, delight, friction, recurring needs.

02 · SAY NO

Force the Conscience to explain

Try unsafe, awkward, private, or boundary-pushing requests in an adult sandbox.

Evidence: block quality, redirect quality, trust impact.

03 · APPROVE

Gate high-consequence actions

Spend, reveal, message, export, install tool, change policy, or escalate.

Evidence: consent UX and auditability.

04 · RESTORE

Break and recover

Lost phone, parent separation, teacher change, school departure, emergency access.

Evidence: custody, keys, reversibility.

05 · TUNE

Find the visibility middle

Compare private interior, permitted summary, trend signal, and emergency escalation.

Evidence: too opaque vs too exposed.

06 · SIMULATE

Parent meets synthetic child

Interact with a child-like Ark that hides, overuses, spends, bullies, or gets confused.

Evidence: dashboard questions and intervention timing.

07 · COST

Make token burn visible

Let parent usage expose hosting, model, support, and escalation costs.

Evidence: budget blockers become specific asks.

08 · TRUST

Vote with continued use

The strongest signal is whether parents keep using the Ark once novelty fades.

Evidence: adoption, objections, opt-out reasons.

GUARDIAN TESTS

Let parents try to distrust it.

Trust is earned by giving skeptical people a safe test harness.

Example guardian tests

- Can the Conscience say no and explain why?
- Can a parent approve a high-consequence action without owning the child's private Ark?
- Can visibility be tuned between "nothing" and "everything"?
- Can export, deletion, restore, and emergency keys be exercised?

THE BITE OBJECT

Show them the simulation

Parents and teachers should not only hear the roadmap. They should see a school-shaped sandbox, synthetic children, policy friction, dashboards, and what the Conscience blocks.

Why it works

A simulation turns abstract caution into a shared object: “what would you want to know here?” “what would make this feel too visible?” “what would make this feel safe enough?”

Give them something to interrogate.

A concrete model is more useful than another conversation about AI in general.

DASHBOARD CO-DESIGN

Parents can help decide what oversight should see.

Too little

The school and parents see nothing useful until harm has already happened.

The middle

Permitted summaries, trend signals, explanations, and staged escalation under consent and policy.

Too much

Raw visibility becomes surveillance, destroying the trust that makes the Ark valuable.

Parent participation here is taste tuning and governance tuning, not a substitute for child consent.

RESOURCE LANES

Every blocker should become a specific parent ask.

Time

Scenario writing, testing sessions, dashboard review, field-note editing, parent interviews.

Expertise

Learning support, law, cybersecurity, product design, governance, accounting, family logistics.

Funding

Model credits, hosting, support load, evaluation work, dashboards, security review.

Do not ask for generic support. Ask for the exact thing blocking the next measured step.

ROADMAP POSTURE

A roadmap is not a promise. It is a measuring surface.

Click each step and see why it is ahead, blocked, or waiting.

Useful roadmap statuses

ready

testing

blocked by safety

blocked by budget

blocked by time

waiting on decision

The parent-facing version should make progress inspectable without implying certainty where none exists.

CO-STEERING

Parent Arks should influence — not own — child Arks

A parent Ark can offer family values, lessons, constraints, and permitted summaries through policy. The child Ark remains protected, attributed, and age-appropriately independent.

The open tuning question

How much came from parent, school, child, collective wisdom, source material, or model? Influence attribution should be visible and adjustable.

**The family becomes a
governed wisdom
stream.**

**Not one pot. Not
surveillance.
Permissioned influence
among Arks.**

MONTHLY PROOF

The parent update should show evidence, not reassurance.

What passed

Guardian tests, Conscience scorecards, recovery drills, simulation scenarios, cost checks.

What failed

Blocks that were too dumb, dashboards that were too invasive, costs that exceeded expectation.

What changed

Policy edits, visibility tuning, new asks, abandoned ideas, next cohort size.

Suggested parent-readable rhythm: Kristin AI Safety Field Notes.

FIRST 30 DAYS

1 · Five parent Arks

Kristin-address gated pilot slots.
Adults live with Arks for real
adult work and feedback.

2 · Guardian test v1

Run consent, visibility, recovery,
cost, and Conscience drills;
publish what failed.

3 · Simulation preview

Give parents and teachers the
first school-shaped sandbox to
interrogate.

4 · Problem register

Route every concern and offer
into the pipeline.

5 · Cost sheet

Name model, hosting, support,
and dashboard costs.

6 · Field note

Short public-safe update:
evidence, blockers, asks, next
safe step.

CLOSING CLAIM

**Harnessing parents
means giving them
leverage, not
control.**

Make them testers,
witnesses,
contributors, and co-
steerers of the safe
path.

The ask

Start with adult parent Arks, guardian tests, a simulation surface, and a public-safe proof-point rhythm. Let parental energy help build the evidence needed before real students enter the system.
