

Defragmenting the User

[Download PDF](#)

From SaaS sprawl to Arks

The pattern we know, but rarely name

[Download PDF](#)

- SaaS sprawl
- identity sprawl
- data silos
- integration spaghetti
- split-brain user state

The person is smeared across the stack.

The technical term

Cross-cutting concern

In old software, some concerns cut across every module.
In old SaaS, **the user** cuts across every application.

Dreamcatcher's phrase

Defragmenting the user

*The person should not be smeared across the tools.
The tools should orbit the person.*

Tools should orbit the person

The car stereo analogy

Left: the car stereo I wanted as a kid.

Right: the car audio system I want now.

Complexity collapses into one trusted connection.

Image brief: maximalist lights/buttons/CD/equalizer versus blank face + Bluetooth-like audio orb.

The phone app analogy

Today: a home screen full of accounts, utilities, badges, permissions, and partial records.

Future: one voice-first agent orb.

The future app is not another app. It is where the other apps stop owning the user.

Enterprise today

Email. Accounting. CRM. HR. Support. BI. On-prem systems.
Documents. Chat. Browser tools.

The same person exists as a thin slice in each one.
SSO helps you log in.

SSO does not put you back together.

Enterprise with a Ark

The Ark holds continuity:

- records
- keys and approvals
- knowledge trail
- policies and preferences
- history and provenance
- personal software context

Services become replaceable tools around the Ark.

Architectural inversion

[Download PDF](#)

Before:

Application owns record → user gets account → integrations recover coherence

After:

Durable Ark owns continuity → services orbit → software comes to the Ark
